

Item 8: NaFRA2 Asset Data Request

The Environment Agency project team working on the New National Flood Risk Assessment (NaFRA2) has contacted partners to collate their asset data. These will feed into a national model covering rivers, the sea and surface water flooding.

SCG feedback has been provided on the technical challenges this poses and the short times scales required of the project make challenging for LA's (~8 weeks).

Therefore CCO will coordinate a strategic response to this request, which as well as helping the NaFRA2 team with their work, will also aid us in the first steps towards a coastal asset register in the next Phase of the monitoring programme.

Before the 9th October, CCO requests authorities to do their best:

- a. review the CCO data, confirm its accuracy (or not), add where possible fill gaps and assign an uncertainty value, or
- b. extract the requested data from local systems.
- c. CCO will then format the data as necessary and submit centrally to the EA.
